

IMAPing 3.0

What is IMAPing?

Have you ever had the Citrix IMA Service, Citrix License Server, Microsoft Net Logon Service or Windows Print spooler hang and not know? IMAPing eliminates this problem by monitoring these services to insure they are functioning properly. If there is a problem IMAPing notifies you immediately via e-mail. No more calls from users who cannot connect to the network!

No email client is required on the MetaFrame Server, and IMAPing is fully configurable. You determine how often you want the selected services checked, who you want to be notified when a problem occurs, whether you want IMAPing to restart a service if a problem is encountered, and if you want to maintain an error event log.

Automatic monitoring of the Citrix IMA Service, Citrix License Service, Windows Net Logon Service and Windows Print Spooler Service.

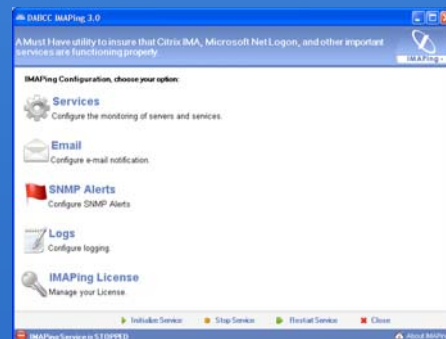

DABCC is pleased to present IMAPing, Version 3.0, a utility specifically designed to help Citrix MetaFrame administrators manage their Server Farms. IMAPing monitors the Citrix IMA and Citrix License Server services as well as the Windows Net Logon and Print Spooler services to insure that they are functioning correctly. If a problem occurs, IMAPing **immediately** notifies the administrator of any issues and can be configured to automatically correct the problem, thus eliminating the problem of a user not being able to connect to a server or not being able to print because of a hung spooler.

The end result is that IMAPing increases user satisfaction and decreases the cost of support. It is a must have for every administrator!

New in Version 3.0

The entire focus of 3.0 is the administrator. It features a new friendly user interface for better usability and simplified licensing and installation. There is no longer a need to install IMAPing on every server in a farm, it can now monitor the entire farm from a single server. Additionally, error information is written to the system event log as well as its own log and the administrator has the ability to determine the level of logging desired.
